Solid Gold Performance for Combines, Hay Machines and Windrowers

GOLD GUARDS

Worth their weight in gold!

Gold Guard's exclusive full point/minipoint design actually doubles the number of cutting surfaces for twice the cutting action of every sickle stroke. Gold Guards also reduce plant side-to-side movement by half – this keeps shelling and shatter loss to an absolute minimum. The heat treated, forged Gold Guards promote increased ground speed, longer life and less maintenance.

SICKLE SECTIONS

The Sharpest Ideas In Cutting!

Gold'N Cut offers 4 models of plated Sickle Sections.

The BearCUT Section utilizes a course serration that sharpens itself as wearing occurs. Ideal for combining, the BearCUT gives you the longest wear for the money. The fine serrated sections and the bottom serrated sections are perfect for haying applications.

All sickle sections feature bolt-on convenience and are heat treated for superior cutting life.

HOLD DOWN CLIPS

Put the spring back into your cutting system.

Any cutting system performs best when well adjusted. **Only Crary Gold'N Cut offers spring loaded, adjustable hold downs as a standard feature on combine and hay cutting systems.** This innovative hold down adjusts with the turn of a bolt, allowing you to maintain uniform hold down pressure while operating a free-flowing sickle. Imagine perfect adjustment in minutes without bending and shimming. Replaceable Nylatron wear pads add 3 or 4 times more life to the hold downs.

THUNDERBOLT SICKLE

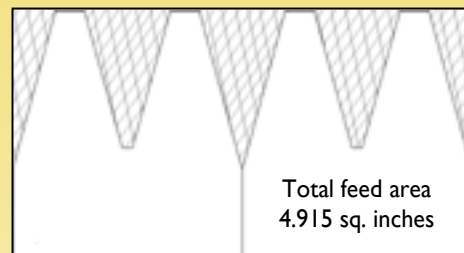

The precious metal connection.

ThunderBOLT's piece by piece design lets you build the exact sickle bar length you need. Easy to assemble interlocking/overlapping bar bolts together for greater field convenience. ThunderBOLT Sickles are UPS-able. Easy to carry and store.

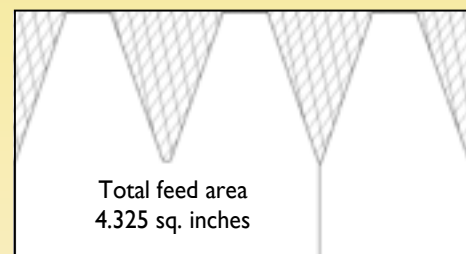

Available with BearCUT or KingKut Sections.

KingKut provides 33% to 77% more feeding area than all other section shapes.

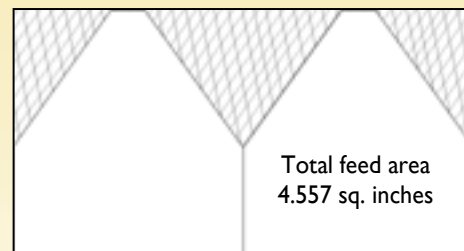

The new KingKut section used with the Gold Guard has 10% - 26% reduced weight from other section designs. The KingKut section also provides 33% - 77% more feeding area than other sections – allowing for less sickle drive wear and increased ground speed.
